Costillas
Las costillas son huesos largos, planos y curvos que forman la caja torácica, protegiendo órganos vitales como el corazón y los pulmones. En los humanos, generalmente hay doce pares de costillas, aunque existen variaciones anatómicas. Se clasifican en tres grupos: verdaderas, falsas y flotantes. Las siete primeras costillas (verdaderas) se unen directamente al esternón a través de cartilagos costales individuales. Las cinco costillas restantes (falsas) no se unen directamente al esternón; la 8ª, 9ª y 10ª costilla se unen al cartilago costal de la 7ª costilla, mientras que las dos últimas (flotantes), la 11ª y 12ª, no se unen al esternón.
